Team Sizes and Software Ship Speed

Small Teams, Fast Shippings

Small teams -- under 10 developers -- tend to ship faster due to less overhead. Direct communication, fewer meetings, and more rapid decision-making are common.

Benefits: Quicker cycle times, flexibility in adapting to changes. Developers have a bigger impact because their work doesn’t get lost in larger workflows.

Challenges: May lack the resource to handle complex projects or large-scale systems. Bug fixes can be urgent since they affect fewer users immediately.

Medium Teams, Balanced Speed

Teams of 10-50 developers often find a good balance between speed and quality assurance. They might use agile methodologies, continuous integration/continuous deployment (CI/CD), and automated testing.

Benefits: Can handle larger projects without the chaos of too many cooks. Regular deployments don’t break the system. Good for product development where features are the focus.

Challenges: Coordination becomes more complex. Time to ship might increase as teams grow due to added layers of management and reviews.

Large Teams, Distributed Workflows

Very large teams (over 50 developers) often have dedicated teams for different parts of the system. They use microservices architecture, distributed version control systems, and sophisticated CI/CD pipelines.

Benefits: Can scale quickly without losing efficiency. Differentiated roles allow deep specialization. Large projects can be divided into manageable pieces.

Challenges: Communication gaps increase with distance. Managing dependencies between services becomes intricate. Ensuring consistent quality across distributed teams requires careful strategy.
