Backup: Your Safety Net

Define the goal clearly. Write it down:

I want backups of all my files on an external drive, with no loss.

Before starting:

1. Create a list of everything to back up -- every file by name.
2. Make a safe backup copy and check its integrity. No guessing!

Steps to follow:

3. Set up the backup at your target destination. Use default settings for accuracy.
4. Run through the main task once. Don't adjust unless necessary.
5. Open backups, test each file. If it doesn't match goal, re-check or fix.
6. Document actions -- easy to replicate, troubleshoot.

Common pitfalls:

Improvising without plan; skipping checks under pressure;
changing multiple things at once -- trap number one.

Checking the work:

The job's done when results match your clear goal. Test every file thoroughly.

Troubleshooting tips:

If something fails, do it again methodically -- change one thing each time and test.

Document all actions for reference -- save time troubleshooting.

When to ask for help:

Reach out for support with money-sensitive data or anything critical
-- don't hesitate.
